Project Overview

The Trip Advisor E-Management app integrates with Salesforce to create a comprehensive travel companion. The app enables users to plan, book, and optimize their travel experiences by managing information related to hotels, flights, and food options. The platform facilitates informed travel decisions, leveraging millions of reviews and insights to support the best choices in accommodations, dining, attractions, and deals.

Objectives

Business Goals:

- Enhance the efficiency and user experience of the travel management process.
- Automate data management tasks, discount application, and email notifications for timely customer engagement.
- Provide seamless tracking and updates to ensure accurate information on hotels, food options, and flight details.

Specific Outcomes:

 Automated synchronization between food options and hotels to ensure accurate hotel data.

- A dynamic discount system for customers based on their spending, enhancing customer satisfaction.
- Scheduled email alerts for flight bookings to ensure timely notifications, improving customer travel experience.

Salesforce Key Features and Concepts Utilized

This project leverages key Salesforce functionalities and concepts to create a seamless and effective food distribution system:

- Custom Objects and Fields
- Hotel: Stores hotel details, including associated food options.
- **Food Option**: Tracks available food choices per hotel (Auto Number: FO- {0000}).
- Flight: Records customer flight details (Auto Number: FL-{0000}).
- Customer: Manages customer details for discount eligibility.
- Flow for Discounts

Created a Flow to apply automatic discounts based on customer spending:

- **Spending > 3000**: Apply higher discount rate.
- Spending between 1500 and 3000: Apply lower discount rate.
- Apex Triggers for Data Synchronization
- **Hotel-Food Option Synchronization:** Developed an Apex trigger that updates hotel information whenever a new food option is added or modified, ensuring accurate food count per hotel.
- Apex Schedulable Class for Flight Reminders

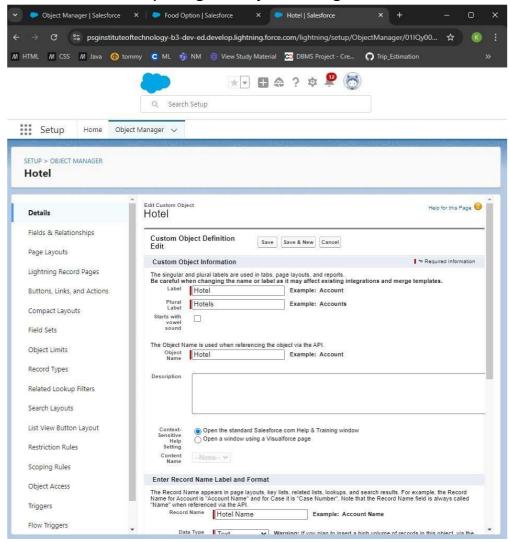

Created an **Apex Schedulable class** to automate email reminders for customers with booked flights.

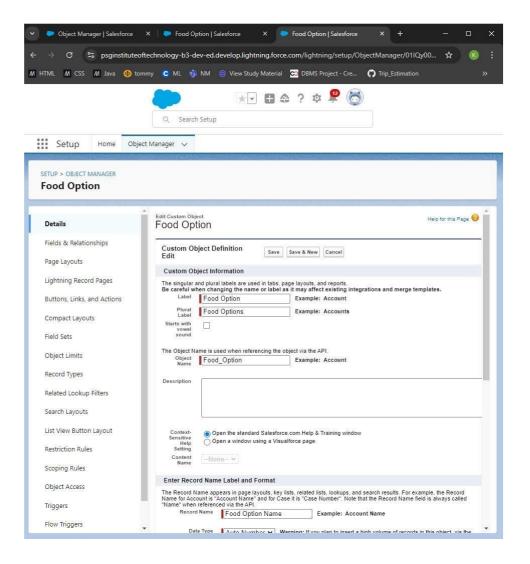

- **Reminder Schedule:** Sends an email notification 24 hours before departure.
- **Confirmation:** System provides confirmation that the email was sent successfully.

These Salesforce features collectively ensure that the project operates with high efficiency, transparency, and data-driven decision-making to maximize food distribution effectiveness.

• Detailed Steps to Solution Design • Created objects

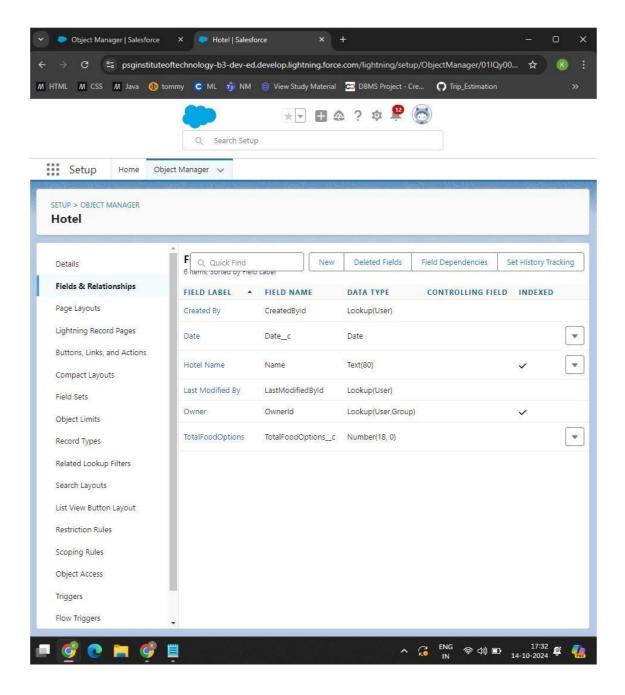

- In the salesforce developer platform, we created custom objects that were required for the project.
- There were 4 main objects
- They were Hotel, Flight, Food Option, Customer.
- This was done by using the object manager

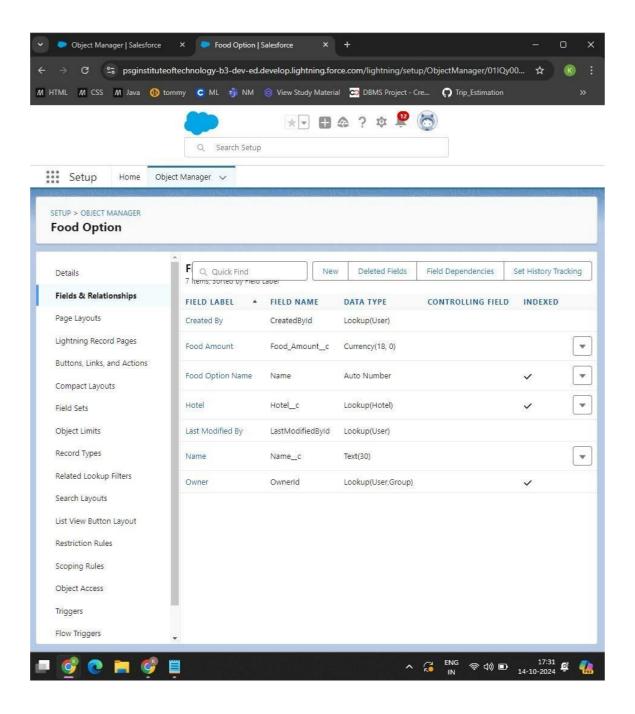

• Created fields for hotel object

- TotalFoodOptions with datatype as number
- Date with datatype as date

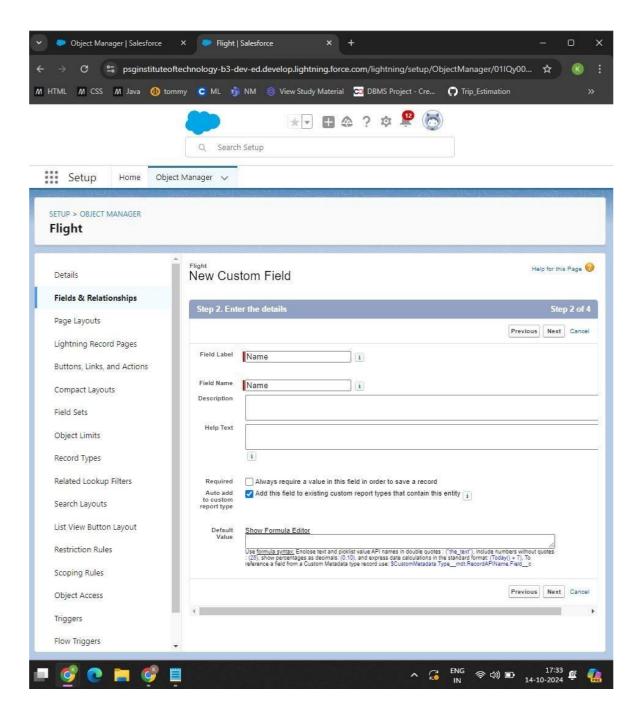

• Create Fields for Food Option

- Food Amount
- Hotel
- Name

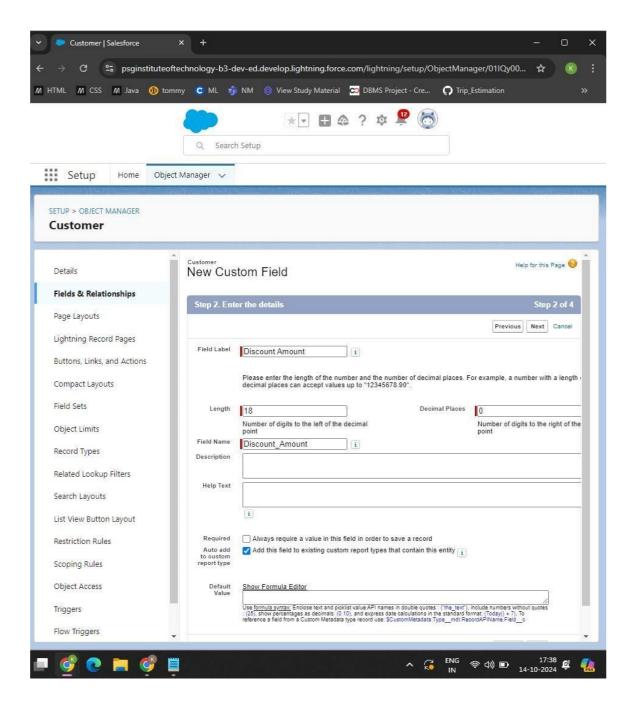

• Created Fields for Flight object

- Name
- DepartureDateTime

• Created fields for customer object

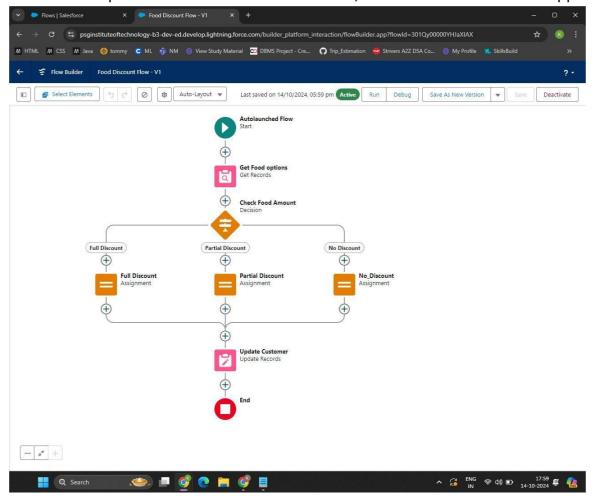

- Customer name
- Discount amount
- Discount percentage

Created Flow

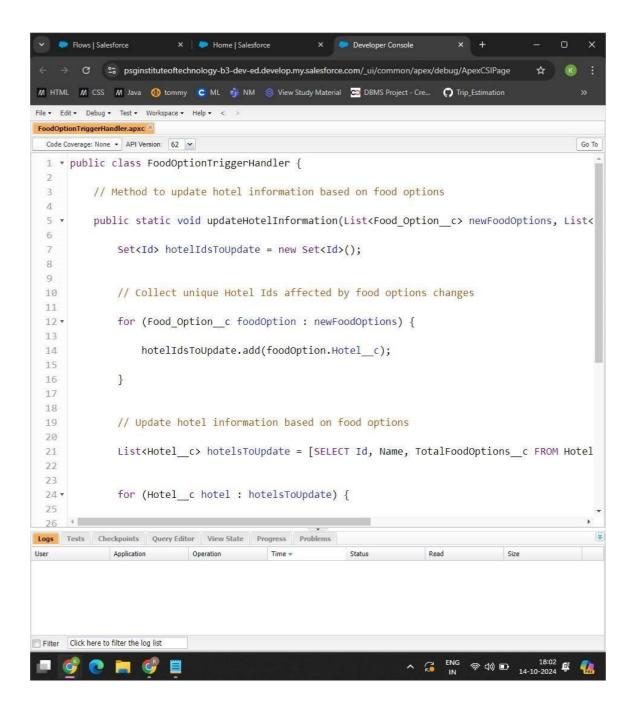

- Developed a **Discount Flow** to automatically apply discounts based on customer purchase amounts. This flow applies discounts in a step-by-step format to ensure ease of entry and accuracy.
- Flow Conditions: The flow is triggered when the customer purchase Amount meets specific thresholds:

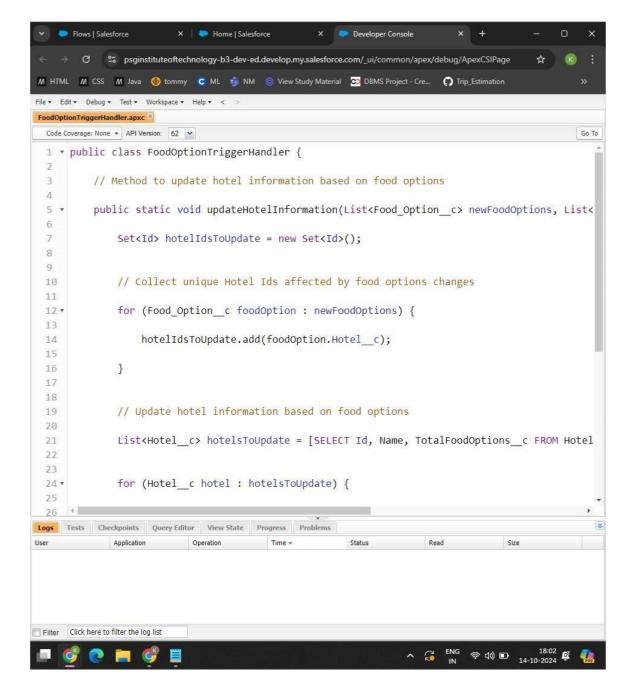

- For purchases greater than 3000, a high discount rate is applied.
- For purchases between 1500 and 3000, a medium discount rate is applied.

• Created Apex Trigger for Food Option

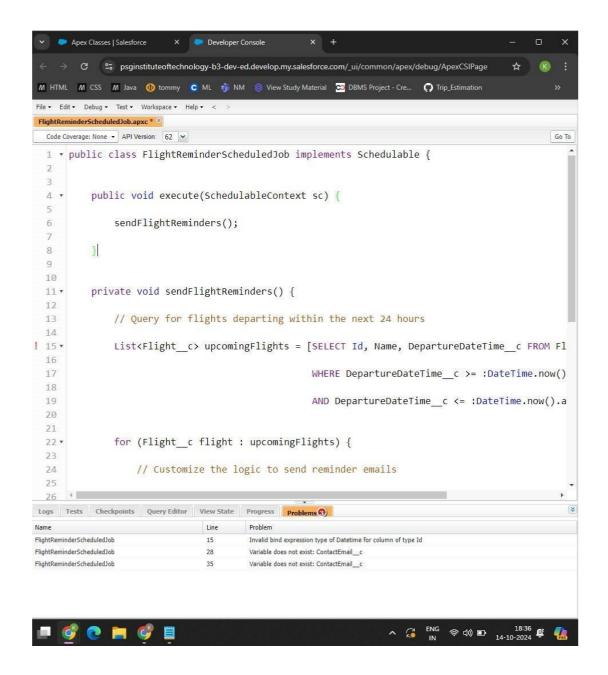

- Developed an Apex Trigger to ensure synchronization between Hotel and Food Option records, maintaining clear and manageable records of food options available at each hotel.
- Trigger Conditions: The trigger is activated whenever a Food Option record is added or updated to reflect changes in the associated Hotel record.

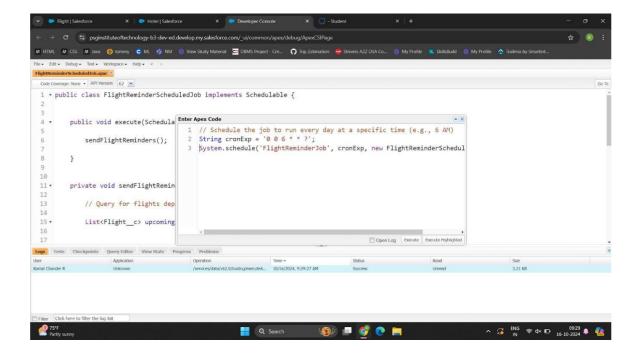

Created Apex Schedule

- Developed an Apex Schedule to send reminder emails to customers who have booked flights, ensuring they receive a notification 24 hours before their scheduled flight.
- The **Apex Schedule** is set to run daily and check for flight bookings scheduled within the next 24 hours.
- If the booking is within 24 hours, an **email alert** is triggered to remind the customer of their upcoming flight.

Testing and Validation Apex Trigger:

Test Class:

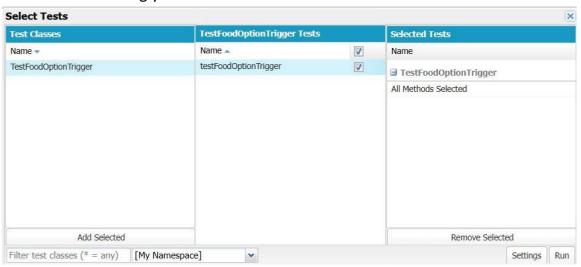

```
@isTest
private class TestFoodOptionTrigger {

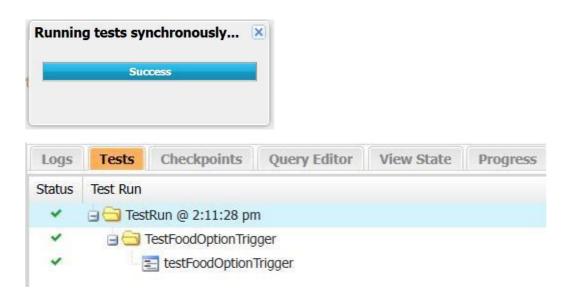

@isTest static void testFoodOptionTrigger() {
    // Create a Hotel record for reference
    Hotel__c hotel = new Hotel__c(Name = 'Test Hotel');
    insert hotel;

// Create a Food Option record linked to the Hotel
    Food_Option c foodOption1 = new Food_Option c(Hotel __c = hotel.Id); insert foodOption1;
    // Verify if Hotel's TotalFoodOptions__c is updated correctly
    Hotel__c updatedHotel = [SELECT TotalFoodOptions__c FROM Hotel __ c WHERE
```

STEPS:

- Step 1: Creates a Hotel __c record with TotalFoodOptions_c initialized to 0.
- Step 2: Inserts a Food_Option __c record associated with the hotel.
- Step 3: Verifies that TotalFoodOptions_c_on the hotel is updated to 1 after adding the first food option.
- Step 4: Adds another Food_Option __c to check if TotalFoodOptions__c increments to 2.
 - Step 5: Updates a food option record to confirm that updates do not affect the count.
 - Step 6: Deletes one Food_Option— c and verifies that TotalFoodOptions c decrements accordingly.

Conclusion

Summary of Achievements:

The **TripAdvisor E-Management** project successfully established an all-in-one travel management platform on Salesforce. Key achievements include:

- Comprehensive Data Management: Created custom objects and fields to manage essential travel data, supporting organized and accessible records.
- **Automated Processes**: Used flows and Apex triggers to enhance operational efficiency, reducing manual input and improving data accuracy.
- **Enhanced Collaboration**: Configured profiles and public groups to allow secure collaboration, protecting data privacy.
- **Real-Time Monitoring**: Developed custom reports and a centralized dashboard for real-time insights into booking trends and customer preferences.
- Improved Decision-Making: Created a streamlined, user-friendly system that supports seamless travel planning and booking, enabling quick, informed decision-making for users.

This project demonstrates the effective use of Salesforce to support a dynamic, usercentered travel management solution, making TripAdvisor an invaluable resource for travelers.

Thank You....
